

Chemspray Copper Oxychloride

Active Constituents

500g/kg Copper Oxychloride: The copper ions inhibit the metabolism of the fungus when they react with sulfur-containing enzymes in the plant. Copper Oxychloride is non-systemic fungicide which forms a protective barrier on the plant surface and thereby prevents fungi from entering the plant host.

Very low levels of copper are toxic to fungi and algae but the levels for mammals is much higher, therefore Copper Oxychloride is of low risk to the gardener when used according to directions.
